

# Setting up a Wordpress site with Ubuntu 22.04 LTS and Cloudflare

Coming (relatively) soon!

## Getting Started

Before we can begin, we need to set up a few basic housekeeping tasks to ensure that we're all good moving forward. This includes setting up the correct timezone, the default text editor, adding a local user that will connect only via SSH and disabling all others - plus locking down root access via SSH.

## Setting time zone

## Configuring editor

## Adding a local user and giving them sudo access
